### **Stevens Introduces System 6000 At Graph Expo**

FORT WORTH, September 11, 2007 -- Stevens Technology, the 57-year-old printing press manufacturer based in Fort Worth, Texas, is releasing the System 6000 web offset press system. Complete with Stevens' new MoreStore™ inker system, the press is designed for commercial and packaging applications. The MoreStore™ equipped System 6000 enables a printer to be more versatile in meeting today's demands, producing text work, full coverage inserts, and direct mail on the same press. "Based on the interest in the new System 6000 expressed by printing companies, we expect our production capacity to be sold out," said Steve Parker, director of business development at Stevens. "The first System 6000 press line will begin testing in early November," Parker continued.

The MoreStore™ inker system is designed to handle those complex ad designs that have heavy solids and knockouts plus 6-point type with serifs. "You know, like you see in ads for automobiles and prescription drugs," said Parker. The MoreStore™ inker system's large capacity means less ink needs to be added when running high coverage jobs such as direct mail. Since the new system uses less dampening solution while printing with greater control, it can achieve brighter colors and higher contrast.

Stevens Technology, LLC designs, manufactures, markets and services web-fed packaging and printing systems and related equipment for its customers in the packaging industry and the specialty/commercial segment of the printing industry.
